

Tank Care Buddy

Session 10 — Water Care Tab & Quick Log Feature

June 9, 2026

Two big feature updates in one session: (1) merged the separate 'Care' and 'Tests' tabs into a single 'Water Care' tab, and (2) added a Quick Log section at the top of that tab so you can prefill the form with one tap.

Water Care tab — merged Tests + Care into one tab

Commit: `e1ae15fb`

- Removed the separate 'Care' and 'Tests' tabs.
- New 'Water Care' tab has the water change calculator AND test fields in one form.
- Saves as a single 'water_care' event (replaces old water_change + water_test events).
- Old water_change and water_test records still show in history — nothing lost.
- `recomputeTankAlerts()` added: clears stale advisor alerts after you save so the banner immediately reflects your new readings.
- `advisor.js` updated to read water_care events for both change and test data.
- All routing (action sheet, history repeat buttons, notifications) updated to point to the new water-care tab.
- History filter updated: new 'Water care' filter added.

Quick Log — prefill buttons + field helpers

Commit: `4ec67222`

- New Quick Log section at the top of the Water Care tab.
- 'Repeat last care' — fills in gallons AND all test readings from your last full session.
- 'Water change only' — fills in gallons, clears test fields.
- 'Test only' — sets gallons to 0, fills in last test readings.
- Field helpers in the test section: 'Same as last', 'Normal' (pH 7.2 / ammonia 0 / nitrite 0 / nitrate 10), 'Clear'.
- None of these auto-save — they only prefill, so you can review before tapping Save.
- All three helper functions (`_lastCarePrefill`, `_lastChangePrefill`, `_lastTestPrefill`) are backward-compatible with old event types.
- Version bump: `v=20260609b`
