

# Tank Care Buddy

Changelog — v20260611l | Thursday, June 11 2026

|                 |                                   |
|-----------------|-----------------------------------|
| Commit          | d6a64ef                           |
| Branch          | main                              |
| Files Changed   | app.js, styles.css, index.html    |
| Version String  | v=20260611k → v=20260611l         |
| Previous Commit | 00f39a9 (modal stacking fix + QA) |

## What Changed

|         |                                    |                                                                                                                                                                                                                                                               |
|---------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [FIXED] | Tab label rename                   | The "Fish" tab now displays as "Livestock". Internal data-tab attribute stays "fish" so no data migration needed.                                                                                                                                             |
| [FIXED] | Tab order rewrite                  | renderTank() tab order is now: Details / Livestock / Water Care / Equipment / History. History is locked as last tab.                                                                                                                                         |
| [FIXED] | Tab bar overflow eliminated        | All 5 tabs now fit on one row without a horizontal scrollbar. Each tab gets flex:1 1 0, font-size:12px, and padding:8px 6px. Removed the old flex:0 0 auto that was preventing equal distribution.                                                            |
| [FIXED] | Equipment filter pills nowrap      | The 4 filter pills (This Week / This Month / Upcoming / All) now stay on a single row. Applied flex-wrap:nowrap, flex:1 1 0, font-size:12px, padding:7px 4px.                                                                                                 |
| [NEW]   | Modal title + footer CSS added     | Added .modal-title (font-weight 600, 17px, drag-handle-aware top padding) and .modal-footer (sticky bottom, flex row, safe-area padding, border-top divider).                                                                                                 |
| [FIXED] | Modal flex structure               | .modal now uses display:flex + flex-direction:column + max-height:88vh + overflow:hidden. Added .modal-inner (flex column wrapper) and .modal-scroll-body (flex:1, overflow-y:auto) so form content scrolls independently of the fixed footer buttons.        |
| [NEW]   | .field + .field-label CSS added    | Equipment form inputs and textareas were completely unstyled before. Added .field (width:100%, border-radius:10px, padding:11px 14px, border, background) and .field-label (font-size:13px, margin-bottom:6px, color:--ink-dim).                              |
| [FIXED] | All 5 equipment modal HTML updated | Every _openEq* modal string in app.js was refactored to use modal-inner / modal-scroll-body / modal-footer structure so the Save/Cancel buttons sit in a sticky footer and form content scrolls above them — eliminating the "squished at bottom" appearance. |

[FIXED] Backwards-compat  
padding preserved

Non-equipment modals (add tank, settings, etc.) keep their original padding: 24px 18px env(safe-area-inset-bottom, 16px) — the new flex structure only activates inside `.modal-inner`.

---

## Why These Changes

User submitted 3 screenshots showing: (1) Equipment tab cut off requiring a horizontal scroll, (2) filter pills wrapping to 2 lines inside the Equipment tab, (3) form modals showing a large dead gray area with content and buttons crammed at the very bottom. All three issues were pure CSS/layout — no data-layer changes required.

---

## Files Touched

|            |                                                                                                                                                                                                                                                                  |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| app.js     | Tab order rewrite, tab label rename, all 5 <code>_openEq*</code> modal HTML refactored to <code>modal-inner/scroll/footer</code> structure                                                                                                                       |
| styles.css | <code>.tab flex fix</code> , <code>.eq-filters nowrap</code> , <code>.modal-title</code> , <code>.modal-footer</code> , <code>.modal-inner</code> , <code>.modal-scroll-body</code> , <code>.field</code> , <code>.field-label</code> — 9 new/modified CSS rules |
| index.html | Version strings bumped <code>k</code> → <code>l</code> on all 10 asset references                                                                                                                                                                                |

---

## QA Notes

Syntax: `node --check app.js` → SYNTAX OK (zero errors).

The `modal-inner` wrapper only activates for equipment modals that explicitly use the new HTML structure. All other modals (add tank, edit tank, settings, water test, advisor) are unaffected — they render directly inside `.modal` and keep their existing padding.

---

## Licensing Impact

None. This release touches only layout CSS and tab/modal HTML strings. No new images, icons, or third-party assets were introduced.

---

## Deferred Items

- Advisor integration for equipment overdue alerts (recommended next step)
- Capacitor packaging
- App Store prep
- Website placeholder fills (privacy policy date, App Store link)
- Support email work

---

## Recommended Next Step

Wire the Advisor system to surface equipment overdue/due-soon alerts. Equipment data is already live via `EQ.dueList()` and `EQ.itemStatus()`. Next step is adding an advisor rule that reads `EQ.tankSummary(tankId)` and injects a max-1 advisor card when `overdue > 0` or `dueThisWeek > 0`.
