

Tank Care Buddy

Changelog · v20260612a · June 12, 2026

Session Summary

Full pre-Capacitor QA + finalization pass. Source-read all JS and CSS files (4,368 + 3,783 lines), ran systematic multi-area QA analysis, found and fixed 3 Critical and 3 Medium bugs, created the /tests folder and first QA report, bumped version strings to v20260612a, and committed everything to main (commit bb6bb83).

Bugs Fixed

#	Severity	Description	Files
C-1	Critical	History filter bled between tanks on navigation (filter from Tank A persisted when opening Tank B)	app.js
C-2	Critical	Equipment modals had double padding (.modal 24px + .modal-inner 20px = 44px top, 36px horizontal)	styles.css
C-3	Critical	Share modal URL pointed to old 'my-tanks' repo (https://...github.io/my-tanks/)	app.js
M-1	Medium	Backup download filename said 'my-tanks-backup-*.json' (old app name)	app.js
M-2	Medium	'Edit tank info' action sheet button had no scroll-to-edit (landed at top of Details tab; edit form is at bottom)	app.js
M-3	Medium	color-mix() used for text color on eq chips (invisible text on pre-Safari 16.2 devices)	styles.css

Fix Details

C-1 · History filter reset

Added let historyPrevTankId = null; at module level. Added reset guard at top of renderHistory(t): if the current tank ID differs from the previous render, reset historyFilter to "all" and update historyPrevTankId. Mirrors the exact pattern already used by the Equipment filter (eqFilter / eqPrevTankId).

C-2 · Modal double-padding

Added CSS: .modal:has(.modal-inner) { padding: 0; }. When the Equipment modal uses .modal-inner as its full-width padding controller, the .modal's default 24px/18px padding is cancelled. The :has() selector is supported Safari 16+ (iOS 16+, Sep 2022). Non-equipment modals (settings, backup, share,

add-tank) do not use .modal-inner and are unaffected.

C-3 · Share modal URL

Changed openShareModal() URL from https://jtsmith7234-rgb.github.io/my-tanks/ to https://jtsmith7234-rgb.github.io/tank-care-buddy/.

M-1 · Backup filename

Changed downloadBackup() filename from my-tanks-backup-{ts}.json to tank-care-buddy-backup-{ts}.json.

M-2 · act-edit scroll-to-edit

Added id="details-edit-section" to the Edit Tank Info section div in renderDetails(). The #act-edit listener now calls go("details") then uses requestAnimationFrame to smooth-scroll the edit form section into view.

M-3 · color-mix() text color fallback

Three CSS rules used color: color-mix(in srgb, var(--gold) XX%, var(--ink)). On pre-Safari 16.2, this evaluates to an invalid value (invisible text). Simplified all three to color: var(--gold). The gold token is already a legible warm amber across all four themes.

Files Modified

File	Change Summary
app.js	historyFilter reset guard + historyPrevTankId; act-edit scroll; details-edit-section ID; share L
styles.css	.modal:has(.modal-inner) padding override; 3× color-mix() text color simplification
index.html	Version bump: all ?v= cache-bust strings 20260611l → 20260612a
tests/2026-06-12-a-qa-report.md	New file — full QA report with reproduction steps, root causes, fix details, remaining risks

Deferred Items (Low / Non-blocking)

L-1 — Dead code: renderClean / bindClean / renderTests / bindTests (~300+ lines, never called from live tab structure). Safe to remove in a future cleanup pass; skipped today per 'minimize risky refactors' policy.

L-2 — data.js and cloud.js still versioned at v=20260530f. These files have not changed; intentional.

L-3 — expandedEventId (history accordion) not reset on tank switch. Unlikely to cause issues in practice (UIDs are random), but worth addressing before App Store.

L-4 — APP_VERSION constant is hardcoded '1.0' in openSettingsSheet(). Not tied to the cache-bust version string. Update before App Store submission.

L-5 — color-mix() backgrounds on equipment chips degrade to transparent on pre-iOS 16.2. Text and border remain visible; acceptable cosmetic regression.

Go / No-Go Recommendation

GO for Capacitor wrapping. All Critical issues are fixed. The app is syntax-clean, mobile-first, and stable. All Medium bugs are resolved. Remaining Low items are cosmetic or deferred by policy and do not block the Capacitor build.

Recommended next step: Run `npx cap init` / `npx cap add ios` against the current main branch (commit `bb6bb83`). Confirm GitHub Pages reflects `v20260612a` before generating the native build. Do not start App Store prep until the first native build is verified.

Commit

Field	Value
